

How To Configure Your Internet Router For GivEnergy Systems

Video Guide:

If your inverter won't connect, check these common causes.

- Router is only broadcasting on 5GHz (needs 2.4GHz).
- Router security is set to WPA3 (needs WPA2).
- SSID or password entered incorrectly.
- Signal strength is too weak (RSSI < 60%).

Troubleshooting:

- Stand near the inverter with your phone to test Wi-Fi signal strength.
- Try separating your Wi-Fi into 2.4GHz and 5GHz bands.
